# Generators

## Built to Order

Harland Simon UPS can supply a wide range of either standby or fully automatic Diesel Generator sets. Generators are available from basic key start units to much larger automated synchronised sets.

A standby generating set with automatic mains failure detection (amf) and changeover facility is an ideal method of providing extended back up power during longer mains outages.

Generators are enclosed in a solid metal casing lined with acoustic insulating material and mounted on a self supporting base complete with integral fuel tank. They benefit from forward facing lockable doors and offer easy access for carrying out routine service and maintenance work.

Our range starts at 5kVA manual start generators through to custom built 2000kVA fully automated sets. Engines are selected from a range of quality approved manufacturers such as Volvo, Cummings, Perkins and Deutz.

### Options & Services
